Session Layer:

1. Creating a Session

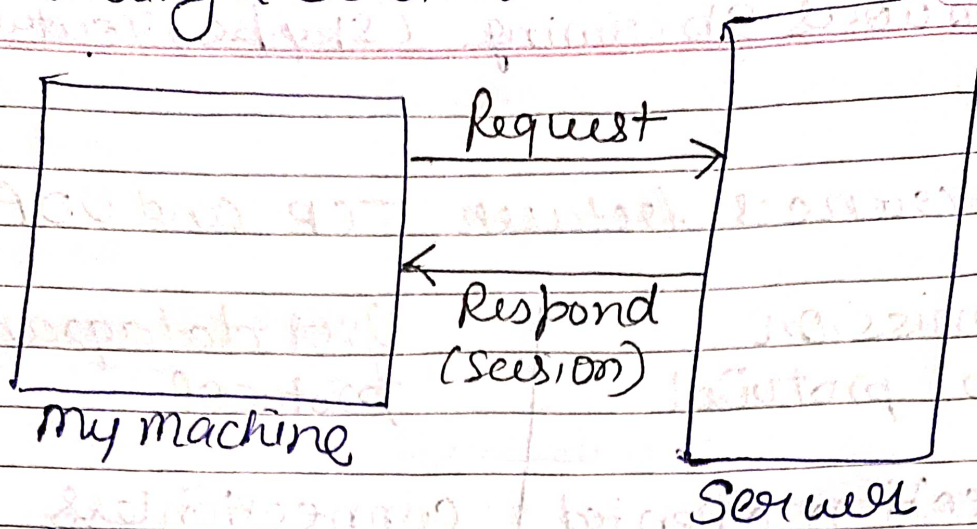

my machine

Server

→ **Authentication:-**

When clients logged in, there credentials go to the server for authentication. Server validate the credential. and respond the permission to create session.

→ **Authorization:-**

When server gives permission to client to create a server it authorizes that client (set of privilages are provided)

→ **Session Restoration:-**

For Example → you are using some tabs on google and the browser close because of something and after some time I open browser then it shows options of restoration.

it uses Session beans → (Checkpointing)

→ webinar:-
there is lip sync problem if multiple people are
talking simultaneously

flow control
Synchronization

→ Session Layer is not a responsibility of
operating system. it is responsibility of Appli
-cation
